# Introduction/Overview

What exactly is Instructional Design?

What is the main challenge facing this industry?

How can we solve this? The opportunity lies in AI.

What's the barrier to effective automation?

So, what is the specific focus of our research?

# Research Question

What data structures and formats are most effective for training AI models in instructional design?

# Literature Review

Framework	Purpose	Approach	Limitation
<b>ARCHED</b> [1]	Generate & evaluate learning objectives	Modular web tool using GPT-4o via API (LOGS + OAE)	No lesson or assessment generation, no fine-tuning
<b>GAIDE</b> [2]	Full course content co-creation	Human-in-the-loop chat-based process using any GenAI (e.g. ChatGPT)	No automation; not scalable; no fine-tuning

# Methodology

## Data Curation

Collected multiple training sources spanning soft skills such as leadership, problem solving etc pertaining to the corporate world

## Content Compression

Summarized into 10-page structured documents using LLM tools and a series of Prompt Engineering

## Pedagogical Structuring

Reformatted into 4 key sections: Objectives, Content, Activities, Assessments

## JSONL Transformation

Converted the samples collected to machine-readable fine-tuning format

## Model Finetuning

Used data to fine-tune Mistral & OpenAI models to generate high quality content

# Findings – Less is More

New Data Format

# Findings – Less is More

Specializes in one topic, memorizes the book.

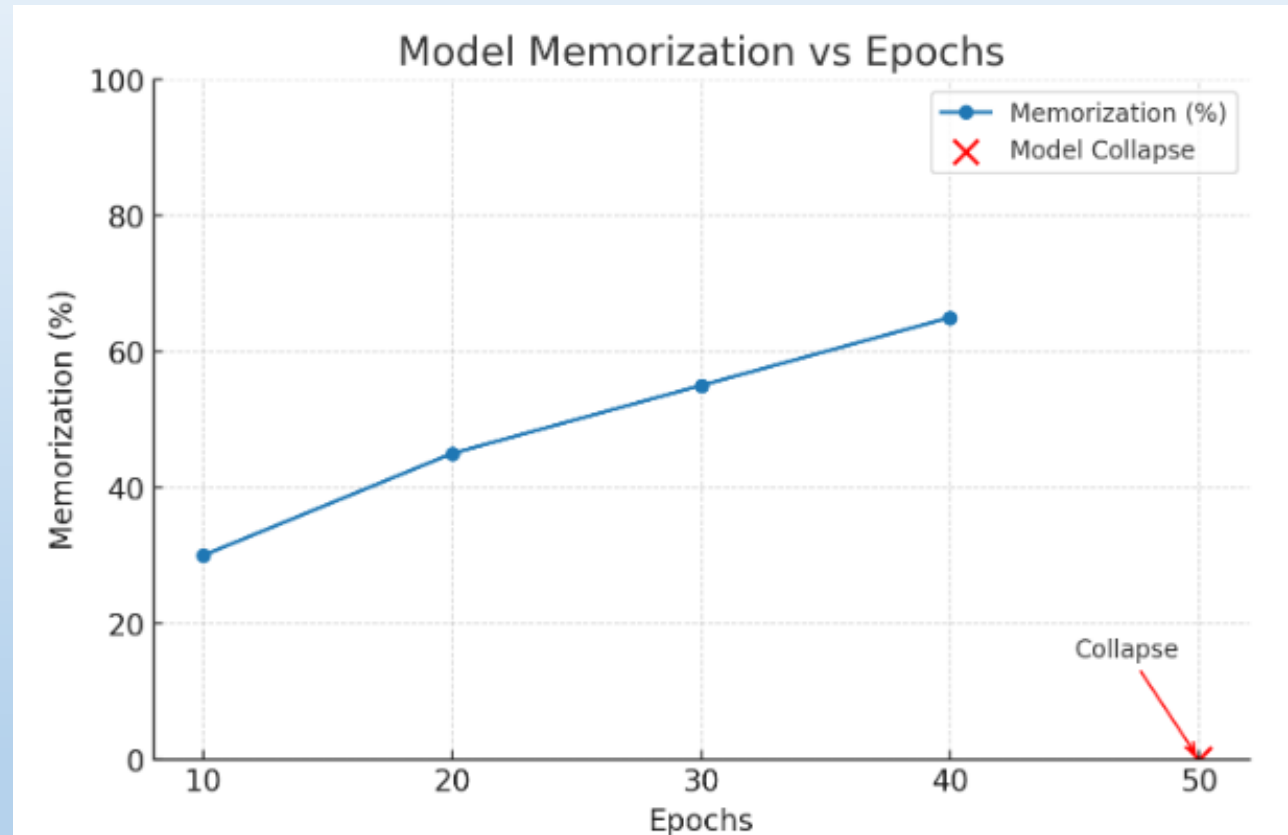

Student who learns from one specialized book

Student who learns from various books

Learns about the concepts in depth.

# Results – Memorization Trends

Data memorization trend chart.

# Results – Comparing Datasets

Version	Response Quality	Response Length (tokens)	Response Time
<b>Version 1 (50 samples)</b>	5/10	~1500	90-120 seconds
<b>Version 5 (300 samples)</b>	8/10	~800	30-60 seconds

Responses were evaluated based on structure, quality of content and quality of assessment methods.  
Response Quality, Length and Time represent average values.

# Conclusion

Created methods  
for condensing  
content.

## Developing AI-Compatible Instructional Design Datasets

**60%**

Better  
Response  
Quality.

**30%**

Better  
Response  
Time.

Created an  
effective data  
structure.

Gathered 500 high-  
quality data samples.

### Future Research Direction:

- Larger Dataset Creation.
- Comparison of Minstrel & OpenAI models.
